Impact

Over the past 3 years, I led software development on the HPVM compiler project which is a key part of our DARPA-funded DSSoC project done in collaboration with IBM Research, Harvard, and Columbia. HPVM is actively used at IBM Research for compiling various applications for the EPOCHs chip - a custom heterogeneous SoC.

- I led two major open-source releases of the HPVM project; release v0.5 was presented at the open-source conference, FOSDEM 2020, and v1.0 is actively used by IBM and academic research groups.
- Collaborating with a robotics startup, Earthsense, I optimized the software stack of an in-production autonomous agriculture robot. Our optimizations reduced the cost of deployed compute hardware by 3x.
- In terms of teaching and collaborating on various projects, I have mentored over 10 PhD and undergraduate students.
